PICTOCHAT
REMASTERED

Authoring Chat App - Dev/Des Document
By: Matthew Tenuta

Description:

I have created a chat app that is fully functional and 2 users could technically chat between browsers on the same computer. You can input your name so the other person knows who you are.

Development:

The chat app was made using Node, Vue, and Socket.

Design:

I have styled to look like Pictochat. If you're not sure what Pictochat is, it was a chat application used back in the day on the nintendo DS and you could chat between consoles and share drawings/messages. I have changed some things since this is a remastered version while still keeping the original charm.

Added portion of the assignment:

For the extra part I had to add, I decided to add the "is typing" functionality to my app. This will be displayed in the chat app itself rather than just in the console window to make it feel more like a proper chat app.

How long did this take?:

Much longer than it should have.
